SNMK

Autonomous Website Security Scanner

A simple executive overview — what it is, how it works, and what it is built with.

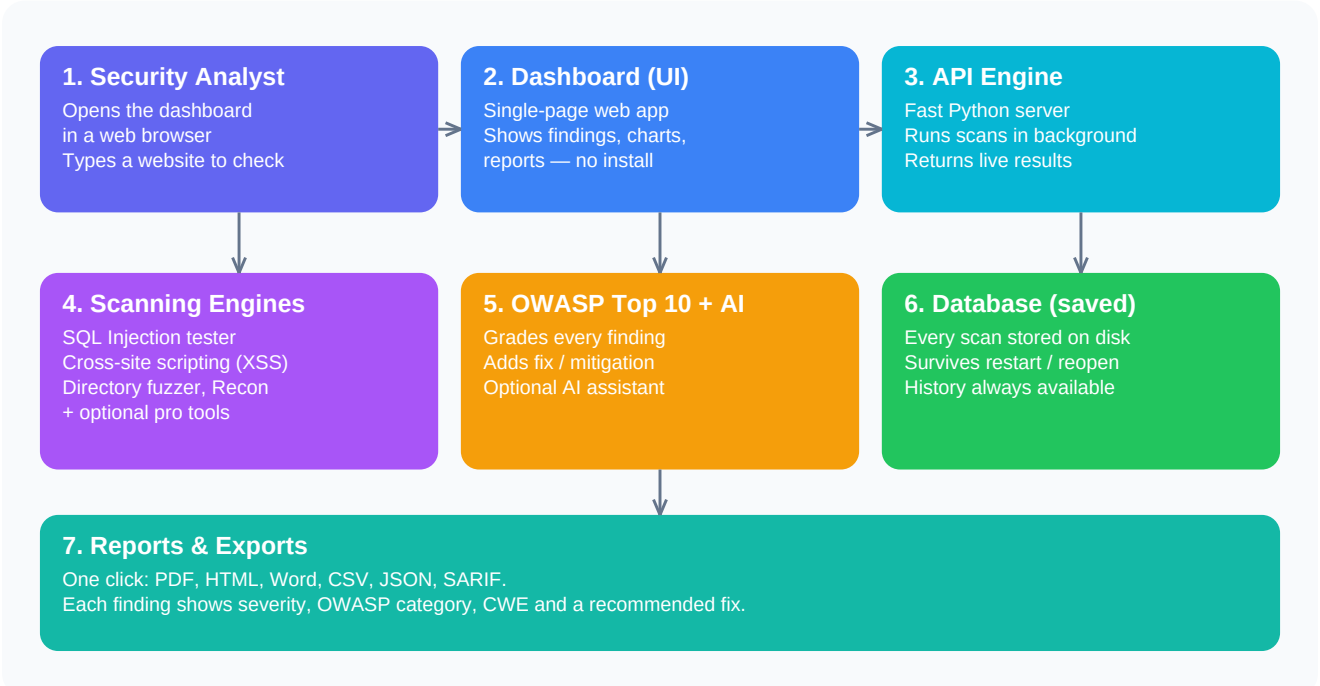
In one line

SNMK is a tool that checks a website for security weaknesses — automatically — and explains each problem in plain words along with how to fix it. You point it at a website you own, it scans, and it gives you a clear report.

What it does for the business

Finds real problems	Tests websites for the most common and dangerous flaws (hacking entry points) and shows what it found.
Speaks plainly	Every problem gets a severity (High / Medium / Low), the industry category it belongs to, and a recommended fix.
Remembers everything	Every scan is saved. Close the tool, reopen it later — your history and past results are still there.
Delivers reports	One click turns results into a PDF, Word, HTML or spreadsheet report for clients, auditors or the team.
Stays safe & legal	It only scans targets you authorize, refuses risky internal addresses, and never damages the site it checks.

HOW IT WORKS — SIMPLE ARCHITECTURE



Read left to right: a person opens the dashboard, types a website, the engine runs many checks in the background, grades each result against the OWASP Top 10 industry standard, saves it, and produces a report.

The technology (plain terms)

The screen you see	A web dashboard built with standard web technology (HTML, CSS, JavaScript). Nothing to install — it opens in any browser.
The brain	A fast Python server (FastAPI) that runs the scans and answers the dashboard instantly.
The scanners	In-house Python engines for SQL-injection, cross-site scripting, hidden-page discovery and reconnaissance. Can also use industry tools (Nmap, Nuclei) when installed.
The memory	A built-in database file (SQLite) that stores every scan safely on the computer.
Optional AI	Can connect to AI providers (OpenAI, Claude, Gemini) to help explain results — works fine without it too.
Runs anywhere	Windows, Linux, Mac, or in a container (Docker).

Honest status — what is real today

We verified this by running the tool live against a test target. The results below are measured, not marketing.

Capability	Status
Core security scanning (SQLi, XSS, fuzzing, recon)	**Working**
Every finding graded with OWASP Top 10 + a fix	**Working (verified 7/7)**
Scan history saved and survives restart	**Working**
Reports export (PDF, HTML, Word, CSV, JSON)	**Working**
Admin name fills in from the computer user	**Added**
Dashboard buttons and sections	**Audited & repaired**
“85 AI agents” marketing claim	**Overstated — ~20 run**

Bottom line: the scanner is genuine and functional. The only honesty gap is the “85 autonomous agents” branding — about twenty actually do work; the rest are placeholders. That is a wording/marketing fix, not a broken product.

Prepared as a non-technical summary of the SNMK platform. Colours in this document match the colour-coded sections now used inside the dashboard.
